

Library Management System

Minor project: simple PPT
for library management

Project Introduction

Library Management System

A library management system is a software application used to manage books in a library the system helps librarians:

Mantain books records

Issue books

Return books

Track book availability

01 Project Overview

The library management system is a Console-based application developed using java that helps manage library operations

Scope

The library management system provides basic functionality for managing books within a library environment. The system enables users to:

- * Add new books to the library collection.
- * View all available books and their details.
- * Issue books to users.
- * Return issued books.
- * Check the availability status of books.
- * Maintain book records in an organized manner.

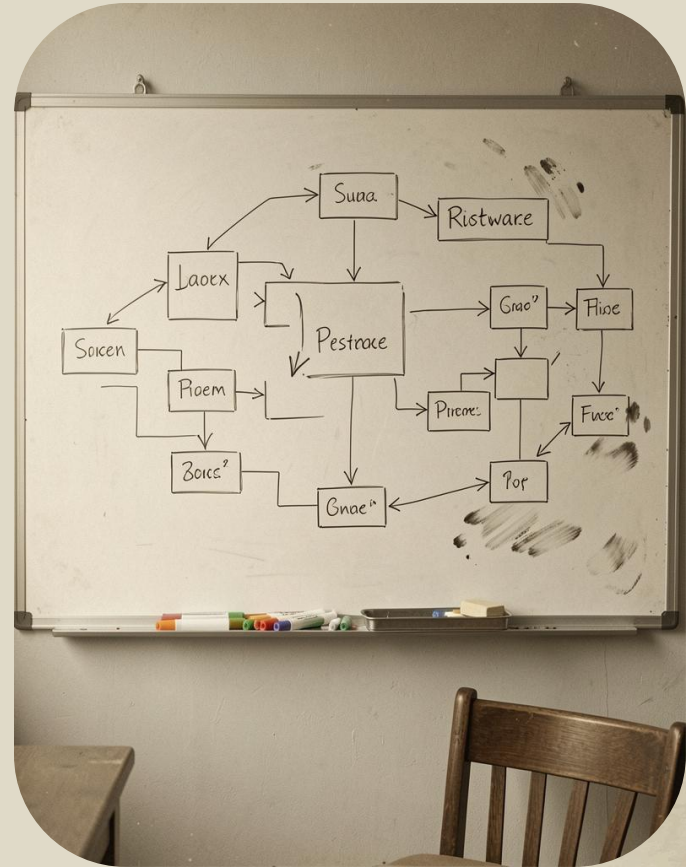

Benefits

- Reduced manual paperwork and record maintenance and simplifies the process of managing library books

Save time in searching and tracking books.and provides quick access to book information.

02 System Design

Architecture

Class Design

Book Class

Stores information related to a book.

Attributes:

*Book ID

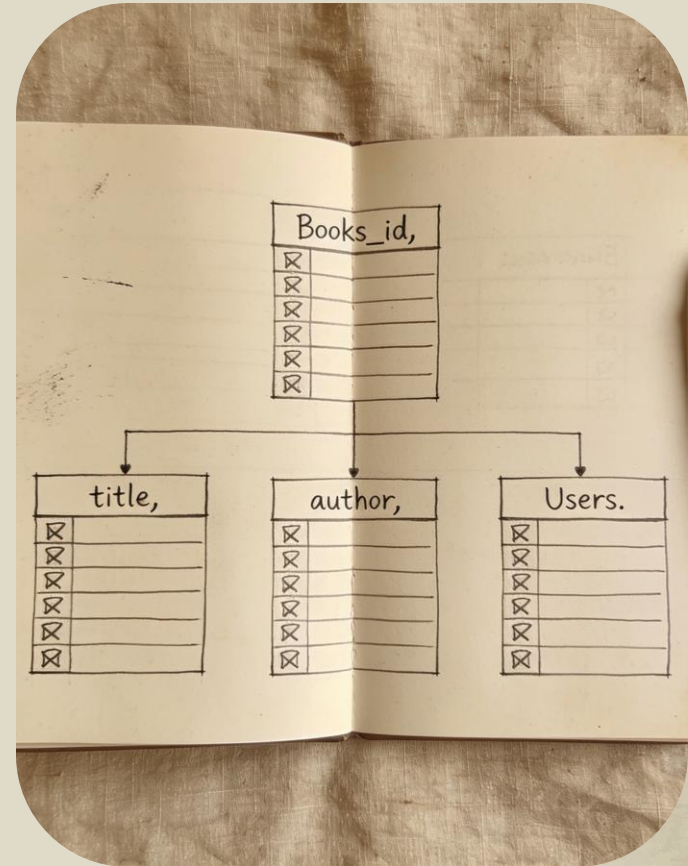

*Tittle

*Author

*Issue status

Database Schema

Although the current system users ArrayList for data storage, a relational database design can be implemented for better scalability and persistence.

UI Flow

Step 1: Start Application

Program starts execution

Step 2: Main Menu Display

The system options:

- *Add Book
- *View Books
- *Issue Books
- *Return Books
- *Exit

Step 3: User Selection

Step 4: Operations Execution

Step 5: Display Results

Conclusions

Library management system

The Library management system developed using java successfully demonstrate how basic library operations can be automated using programming concepts.

Final statement

The system provides a strong foundation for developing more advanced applications such as database-based or GUI-based library management system in the future.
